## 01 MOTEGI RACING MR125 RACING WHEEL

This track-inspired 7-spoke wheel is manufactured using Motegi Racing's Flow Form Technology (FFT). This process manipulates the material flowing into the rim wall in a manner that the wall thickness can be reduced, while maintaining the strength and durability of a thicker and heavier wheel. The MR125 features Motegi's new two-piece center cap that consists of an engraved outer aluminum ring and a molded centerpiece that allows the owner to run cap open or covered. The MR125 is available in a Satin Black or Titanium Silver finish.

## 02 SKUNK2 MEGAPOWER HEADER FOR RSX AND CIVIC SI

Skunk2's MegaPower header is designed and engineered to maximize exhaust flow and increase both horsepower and torque throughout the powerband. Each Skunk2 MegaPower header features equal-length, sequentially paired, stepped primaries that terminate into a collector with a 2.5-inch outlet. These features, paired with Skunk2's unique design specs, provide an extremely broad powerband that's applicable to a wide range of engine sizes and configurations.

## 03 AFE POWER LEXUS IS-F AIR FILTER

All aFe performance air filters produce high flow to increase horsepower, torque, throttle response and fuel mileage without substituting filtration efficiency. The unique polyurethane progressive bump seal provides a superior seal and keeps debris from flowing through the filter. All aFe filters are washable and reusable and have a limited lifetime warranty. In recent testing, this filter flowed 66 percent more than the factory air filter.

## 04 TAKEDA USA '06-10 CIVIC COLD AIR INTAKE

This intake utilizes specially designed two-piece polished aluminum intake tubes to efficiently guide the air into the motor and also provide an aggressive touch of style. Takeda air intakes use Pro Dry S filters, which require no oil to recharge for maximum convenience and filtration. In recent testing, this intake produced 7 hp and 7 ft-lbs of torque over stock and out-flowed the factory intake by 37 percent.

## 05 DEI TYPHOON TURBINE

The Typhoon is a turbine designed to feed nitrous into the throttle body, bringing a new and efficient way to improve delivery of nitrous into your motor. Using the 900-1,000 psi of pressure created during nitrous activation, the Typhoon turbine acts like a jet engine, revving up the flow of the mixture into the engine and increasing horsepower and torque by up to 20 percent. The Typhoon turbine housing is CNC machined from billet aluminum and is capable of spinning at 10,000-12,000 rpm.
